## To Version Control or Not?

AUTHOR:

Paul Boag

DATE:

18 August 2008

CATEGORY:

Development, Digital  
Strategy

---

Version control can seem like a very daunting thing to incorporate into your work flow, but once it's there you can be left wondering how you ever lived without it. Paul Stanton gives his thoughts and experiences on the subject.

# Introduction: Drivers of Version Control

## ❖ Individual drive

- Proper backup  
(literally every [committed] change)
- Make changes without fear

## ❖ Collaboration drive

- Work on the same codebase
- Ease for collaboration
- Quality

# Introduction: Three generations

| Generation | Networking  | Operations         | Concurrency         | Examples  |
|------------|-------------|--------------------|---------------------|---|
| First      | None        | One file at a time | Locks               | RCS, SCCS   |
| Second     | Centralized | Multi-file         | Merge before commit | CVS, SourceSafe, Subversion, Team Foundation Server |
| Third      | Distributed | Changesets         | Commit before merge | Bazaar, Git, Mercurial                              |

Summary

# Git hands on: installation

## ❖ Linux

\$ apt-get install git

## ❖ Windows (<https://gitforwindows.org>)

– gui + git bash

## ❖ Mac

<https://git-scm.com/downloads>

# Git hands on: Getting started

```
$ cd 'the-folder-to-version-control'
```

```
$ git init
```

```
$ git status
```

```
$ git add --all
```

```
$ git status
```

```
$ git commit -m 'first commit'
```

```
$ git status
```

```
$ git log
```

```
$ git HIT-TAB
```

# Git hands on: Ignore things

```
$ echo "*.sh" >> .gitignore
```

Get recipes from: <https://github.com/github/gitignore>

# Git hands on: working with remote repo

## Start from remote:

```
$ git clone 'project-repo-url'  
$ git remote -v (see remote info)  
$ 'do stuff'  
$ git add -all  
$ git commit -m 'some comment'  
$ git push
```

## Start from local:

```
$ cd 'the-folder-to-version-control'  
$ git init  
$ 'do stuff'  
$ git add -all  
$ git commit -m 'some comment'  
$ git remote add origin git-repo-uri  
$ git remote -v (see remote info)  
$ git push -u origin master
```

# Git hands on: branching & merging

```
$ git checkout -b <branch-name>
```

```
$ git add -all
```

```
$ git commit -m 'modifications in a new branch'
```

```
$ git push -u origin <branch-name>
```

Submit a merge request !

# Git hands on: more . . .

## ❖ Forking

- Is feature of github & gitlab(not part of basic git)
- fork process: Fork => make changes => submit a pull request
- It creates a local copy of the base repo and gives more freedom to play with it

## ❖ Advanced stuff

- git blame some-file
- git stash . . .
- git diff branch-1 branch-2
- . . .

Introduction

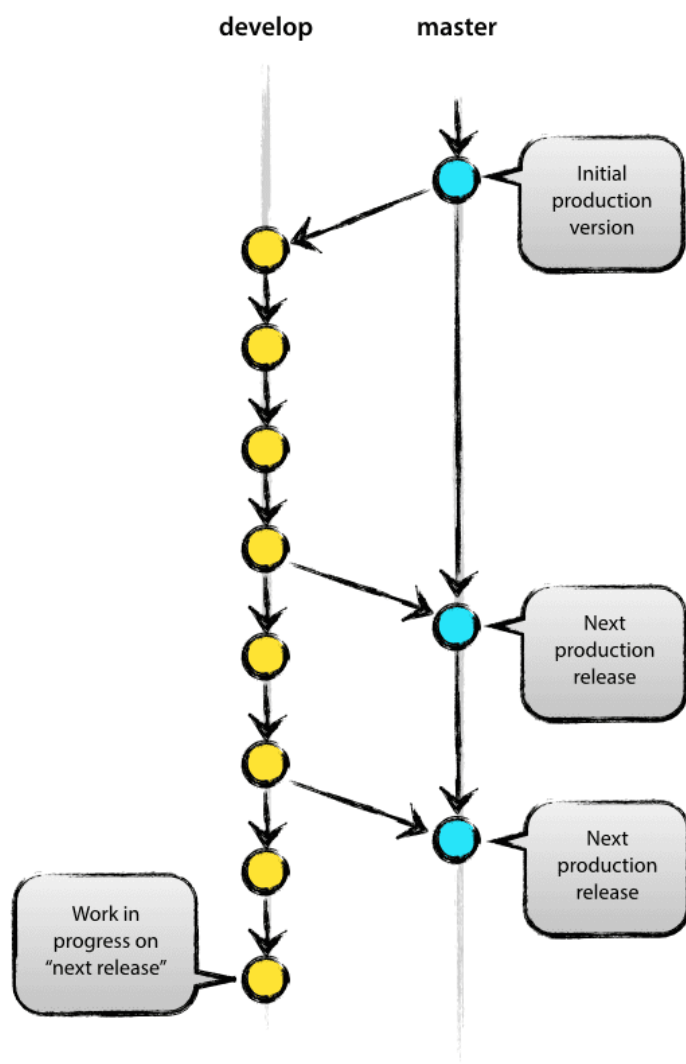

Git hands on

**Best practices**

Summary

# Best practices

- ❖ Branch, **don't fork** (if possible)
- ❖ **Commit** your changes as often as you can
- ❖ Limit the number of “**maintainer**” role members
- ❖ Follow recommended **branching strategy**
  - master, feature-branch
  - master, develop, feature-branch
- ❖ **Feature-branch** should be
  - single purpose
  - short lived
- ❖ **Tag** releases properly
- ❖ Use **CI / CD** (Continuous Integration, Continuous Delivery)
  - trigger on specified branches
  - automate build, test, deploy actions
